

## OpsHub Integration Manager

### Integrating Application/Product Lifecycle Management

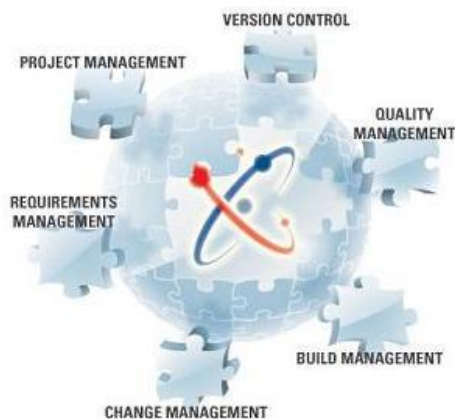

OpsHub Integration Manager enables application and product development organizations to realize the full potential of their existing software development tools and applications or any new tools planned for the development environment. OpsHub Integration Manager provides a common platform for integrating disparate software tools and applications to reduce development cycles and maximize value from existing software investments.

### Taking Collaboration to the Next Level

The OpsHub Integration Manager “enterprise class solution” enables real collaboration among the various functional teams like product development, quality and product management. Unlike older technology the OpsHub Integration Manager enables bi-directional communication and seamless entity synchronization and integration for all development tools and systems in the engineering ecosystem. This end-to-end visibility across the product/application development lifecycle allows companies to streamline the product planning and application development efforts and eliminates wasted time, effort, and cost throughout the process. As a result companies now get customer-driven products to market faster, and improve the ratio of hits to misses.

### Integrating Data from Disparate Life Cycle Management Systems

OpsHub Integration Manager supports the leading, best-of-breed software development tools and systems. It has been architected, designed and built to enable multi-directional synchronization across an existing development environment, delivering seamless process workflows and ensuring data is up to date across those systems.

#### Systems Supported

Accept 360, Accurev, Agilefant, Atlassian Jira, Bugzilla, CVS, Git, HP ALM, HP Quality Center, IBM Rational ClearQuest, IBM Rational DOORS, IBM Rational RequisitePro, IBM Rational Team Concert, Microsoft Team Foundation Server, Mercurial, Perforce, RallyDev, Redmine, Replay Solutions, Seapine Test Track, Serena Business Mashups, SmartBear ALMComplete, SmartBear QAComplete, Subversion, Trac, VersionOne

#### **OPSHUB AT A GLANCE**

##### Business

Enterprise class application integration for application and product development organizations

##### Customers

Application and product development organizations that need better synchronization and collaboration between their diverse functional team.

##### Product

OpsHub Integration Manager

##### Systems Supported

- Accept 360
- Accurev
- Agilefant
- Atlassian Jira
- Bugzilla
- CVS
- GIT
- HP ALM
- HP Quality Center
- IBM Rational ClearQuest
- IBM Rational DOORS
- IBM Rational RequisitePro
- IBM Rational Team Concert
- Microsoft Team Foundation Server
- Mercurial
- Perforce
- RallyDev
- Redmine
- Replay Solutions
- Seapine TestTrack Pro
- Serena Business Mashups
- SmartBear ALMComplete
- SmartBear QAComplete
- Subversion
- Trac
- VersionOne

##### Locations

##### **US Corporate Headquarters**

1020 Corporation Way, Suite 206  
Palo Alto, CA 94303  
+1 650-701-1800

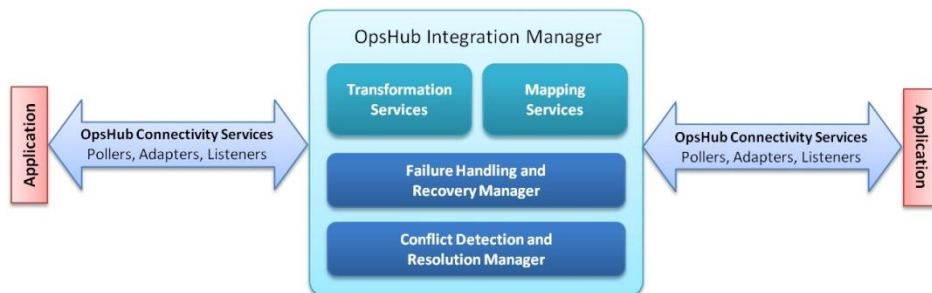

##### **India Office**

B-205, Shivalik Yash,  
Pallav Cross Rd, 132 Ring Rd  
Ahmedabad.-380 013  
India

## How OpsHub Integration Manager Works

The OpsHub Integration Manager is controlled by configurable mapping rules. The OpsHub Integration Manager queries data, states, and logic from each application, mapping and synchronizing that data between your organization's multiple applications as instructed. This gives every user of each individual system constant visibility into status changes across the development environment, without leaving their native application. In synchronizing data between applications, OpsHub Integration Manager ensures that all information is clean, up-to-date, and traceable. It also validates and transforms the data between systems using dissimilar data formats and standards.

Change conflict is a common scenario in an integrated environment. OpsHub Integration Manager comes with built-in support for conflict detection and resolution. All conflicts due to concurrent modification of information are detected by OpsHub Integration Manager and get resolved through configurable conflict resolution methods.

Similarly if data fails to synchronize due to reasons like system downtimes or communication link failures, OpsHub Integration Manager's auto-recovery mechanism handles such scenarios as per your configured workflow, keeping human intervention at the minimum.

### Key Features

- Multi-directional synchronization between your key application development systems
- Robust and highly reliable enterprise-class architecture, eliminating the rigidity of hard-wired point-to-point integration of applications
- Fully scalable platform to support integration with your additional tools and systems
- Customizable business rules to define field and value mappings between your systems
- Data validation and transformation between systems using dissimilar data formats and standards
- Built-in support for conflict detection and management
- Advanced logging and recovery management

The OpsHub Integration Manager is an enterprise grade product that synchronizes information across your standalone, best-of-breed application development systems, facilitating integrated and collaborative software engineering.
