

## Visual Studio Team Services (VSTS) Integration with JIRA

The integration of Visual Studio Team Services (VSTS) and JIRA gives real-time visibility to the product management and development team in each other's work. With this kind of visibility, it becomes easier for both the teams to coordinate on: planning of iterations, breakdown of feature requirements, estimation of efforts and tracking of actual efforts, and quality parameters set for feature requirements.

### Integration overview

In an Application Lifecycle Management (ALM) ecosystem, the choice of systems and the collaboration between the cross-functional teams play a great role. While the choice of systems impacts the productivity of a team, the cross-functional collaboration helps the teams get complete context of the business requirements.

Best-of-breed systems such as JIRA and Visual Studio Team Services (VSTS) bring rich functionalities to the ecosystem. By integrating VSTS with JIRA, enterprises can seamlessly manage product development. The developers using JIRA will have clear visibility into the exact feature requirements and real-time access to any changes/enhancements made to the requirements. On the other hand, VSTS users will have complete view into development of a requirement is progressing.

### How Visual Studio Team Services (VSTS) - JIRA integration is beneficial for an enterprise

- Access to all test cases, defects, and QA plan
- Trace the requirement breakdown completely - access the features, stories, tasks associated with the requirement
- Developers are always up-to-date on feature requirements and associated updates
- Track the estimated and actual development efforts
- Get complete context of the business requirement and receive real-time updates when there is a change in the plan
- Coordinate on the delivery timelines seamlessly with concurrent updates on changes

#### With Visual Studio Team Services (VSTS) + JIRA integration, enterprises can:

- Make better and faster decisions
- Enhance collaboration between business and backend teams
- Ensure complete traceability of all stories
- Ensure quality delivery in stipulated time
- Leverage the best of functionality and collaboration in the delivery ecosystem

### How OpsHub Integration Manager integrates Visual Studio Team Services (VSTS) and JIRA

OpsHub Integration Manager integrates Visual Studio Team Services (VSTS) and JIRA bi-directionally. It ensures that all historical and current data is available to each user, in that user's preferred system, with full context, in real-time. All 'requirements' from VSTS automatically synchronize to JIRA where they are broken down to 'stories'. The completion of the story and the status of test results against it automatically synchronizes to VSTS.

#### Entities that can be synchronized between Visual Studio Team Services (VSTS) and JIRA

The popularly synchronized entities between VSTS and JIRA are on the left:

## Benefits of integration for Visual Studio Team Services (VSTS) and JIRA users

VSTS users	JIRA users
Traceability for business requirements throughout the ALM tool chain	Real-time updates on feature requirements and associated changes/enhancements
Access to complete development plan & visibility into the progress of development work	Clear visibility into quality parameters and test results from JIRA itself
No dependency on manual communication for making business decisions	No manual efforts needed to keep product management teams updated on the development status

## Features of OpsHub Integration Manager

Supports unidirectional as well as bi-directional synchronization between 50+ systems

Maintains complete history and audit trail among integrated systems

Allows traceability between code to requirement, tickets to defects, and many other entities

Provides a robust failure management and recovery mechanism

Can be hosted by OpsHub, installed on-premise, or deployed in a customer cloud

## Pre-requisites to run OpsHub Integration Manager

### Supported Operating Systems

#### Windows

- Windows Server 2012 R2
- Windows Server 2012
- Windows Server 2008 R2 (64 bit)

#### Linux

- RHEL 5.2 + (64 bit)
- RHEL includes Cent OS and Fedora

#### Tested on the following versions:

- CentOS release 5.5 (Final)
- CentOS release 5.6 (Final)
- CentOS Linux release 7.1.1503 (Core)
- Fedora 20

### Database Prerequisites

The underlying database should be installed to install and run OpsHub Integration Manager. The database user created for OpsHub Integration Manager should have schema level and read write privileges.

- MySQL Server
- MS SQL
- Oracle
- HSQLDB
